**30 YEARS OF SERVICE**

**We have been supplying VW parts  
since 1980**

Due to the overwhelming popularity of Beetles and Campers over the last few years, secondhand parts have become very hard to source at realistic prices. We have decided to try to recondition as many parts as possible. We will now be charging a surcharge on some secondhand parts. This will allow us to offer refurbished parts to future customers. We hope this will make finding parts in the future slightly easier.

This will involve the return of your old unit, we do appreciate this may be a little inconvenient, but if we don't take these steps, secondhand parts supply will dry up and everyone will lose out. We now buy secondhand parts from all over the world to try to keep up with demand, so the price of parts may fluctuate depending on when and where we bought them. Sorry for any inconvenience this may cause.

If we don't have a part in stock we may be able to locate it for you, so give us a try and we will do our best to help.

## **PAYMENT**

We accept the following forms of payment:

Cash - Shop customers only!

Cheques - Please supply guarantee card number and address details

Credit/Debit Card - Visa, Mastercard

### **MEGATIPS = How to Re-Polarize Your Dynamo**

After leaving your vehicle standing for long periods with a flat battery or replacing your dynamo you may need to re-polarize it. To enable it to charge the battery correctly.

1. Disconnect battery
2. Remove fan belt
3. Remove all wires from dynamo
4. Take a length of wire from the battery '+' terminal to the 'D+' terminal on dynamo
5. Take a wire from battery '-' terminal to 'D-' terminal on dynamo, then link 'D-' to 'DF'.  
The dynamo will turn like an electric motor.
6. After 10 secs remove wires and reconnect original connections. **JOB DONE.**

Our Secondhand Starter Motors, Dynamos & Alternators are now exchange.  
This allows us to recondition more parts and helps us keep more of your VWs on the road.

### **MEGATIPS =**

To convert from a dynamo to an alternator the voltage regulator needs to be removed from the system. There will be 3 large red wires going to the voltage regulator, these need to be joined together with the use of a good isolated joining block, there will also be a small blue and a small green wire at the regulator, these also need to be connected together. At the engine the large red wire is connected to the nut terminal on the alternator and the small green wire to the spade terminal, sometimes there is a small brown earth wire that can be connected to the body of the alternator.
